TGF-β2 ELISA

Enzyme immunoassay for the quantitative determination of transforming growth factor β2 (TGF-β2) in human serum, plasma or cell culture supernatant.
1 INTRODUCTION

1.1 Intended Use
The IBL TGF-β2 ELISA is an enzyme immunoassay for the quantitative in vitro diagnostic measurement of TGF-β2 in serum, plasma and cell culture supernatant.

1.2 Summary and Explanation
Transforming growth factor-β (TGF-β) is a multipotent Cytokine with cell- and dose-dependent activities. This molecule is produced by a number of cells and tissue types, e.g. thrombocytes, bone tissue, placenta and kidneys. TGF-β2 is not produced by blood platelets, contrary to TGF-β1. This potent Cytokine modulates embryonic development, bone formation, mammary development, wound healing, hematopoiesis, cell cycle progression and the production of the extracellular matrix. TGF-β2 – null mice were shown to exhibit perinatal mortality and a wide range of developmental defects for a single gene description which include cardiac, lung, craniofacial, limb, spinal column, eye, inner ear and urogenital defects. TGF-β2 has been shown to be a potent growth inhibit factor in the regulation of postnatal cerebellar neurons and neuroblast proliferation. TGF-β2 has been detected in tear fluid. TGF-β2 levels are elevated in the vitreous of patients with proliferative diabetic retinopathy. Elevated plasma levels of TGF-β2 have been described in patients with disseminated malignant melanoma. TGF-β2 concentrations are furthermore elevated in Parkinson’s disease in ventricular cerebrospinal fluid.

2 PRINCIPLE OF THE TEST
The IBL TGF-β2 ELISA Kit is a solid phase enzyme-linked immunosorbent assay (ELISA) based on the sandwich principle. Prior to testing the standards and patient samples are diluted in assay buffer, acidified with HCl and then neutralized with NaOH. Afterwards, the neutralized standards and samples are added to the antibody coated (polyclonal) microtiter wells. After the first incubation the unbound sample material is removed by washing. Then a biotinilated mouse anti TGF-β2 antibody and the Streptavidin-HRP Enzyme complex are incubated in succession. An immuno enzyme sandwich complex is formed. After incubation the unbound conjugate is washed off. Having added the substrate solution, the intensity of colour developed is proportional to the concentration of TGF-β2 in the patient sample.

3 WARNINGS AND PRECAUTIONS
1. This kit is for in vitro diagnostic use only.
2. For information on hazardous substances included in the kit please refer to Material Safety Data Sheets.
3. All reagents of this test kit which contain human serum or plasma have been tested and confirmed negative for HIV I/II, HBsAg and HCV by FDA approved procedures. All reagents, however, should be treated as potential biohazards in use and for disposal.
4. Avoid contact with Stop Solution containing 0.5 M H₂SO₄. It may cause skin irritation and burns.
5. Never pipet by mouth and avoid contact of reagents and specimens with skin and mucous membranes.
6. Do not smoke, eat, drink or apply cosmetics in an area where specimens or kit reagents are handled.
7. Wear disposable latex gloves when handling specimens and reagents. Microbial contamination of reagents or specimens may give false results.
8. Handling should be in accordance with the procedures defined by an appropriate national biohazard safety guideline or regulation.
9. Do not use reagents beyond expiry date as shown on the kit labels.
10. All indicated volumes have to be performed according to the protocol. Optimal test results are only obtained when using calibrated pipettes and microtiterplate readers.
11. Do not mix or use components from kits with different lot numbers. It is advised not to exchange wells of different plates even of the same lot. The kits may have been shipped or stored under different conditions and the binding characteristics of the plates may result slightly different.
12. Chemicals and prepared or used reagents have to be treated as hazardous waste according the national biohazard safety guideline or regulation.
13. Safety Data Sheets for this product are available upon request directly from IBL-International GmbH. The Safety Data Sheets fit the demands of: EU-Guideline 91/155 EC.
4 REAGENTS

4.1 Reagents provided

1. *Microtiterwells*, 12x8 (break apart) strips, 96 wells;
   Wells coated with anti-TGF-β2 antibody (polyclonal).
2. *Standard (Stock Standard)*, 1 vial, 2 mL,
   Concentrations: 1000 pg/mL
   see „Preparation of Reagents“.
   * contains < 0.015% BND and < 0.010% MIT as preservative.
3. *Assay Buffer, 10X concentrate*, 1 vial, 10 mL,
   Concentrations: 0 pg/mL
   see „Preparation of Reagents“.
   * contains 0.015% BND and 0.010% MIT as preservative.
4. *Enzyme Conjugate*, 1 vial, 11 mL, ready to use,
   Mouse anti TGF antibody conjugated to Biotin.
   * contains 0.03% Proclin 300, 0.015% BND and 0.010% MIT as preservative.
5. *Enzyme Complex*, 1 vial, 11 mL, ready to use
   Streptavidin Peroxidase
   * contains 0.03% Proclin 300, 0.015% BND and 0.010% MIT as preservative.
6. *Substrate Solution*, 1 vial, 14 mL, ready to use,
   Tetramethylbenzidine (TMB).
7. *Stop Solution*, 1 vial, 14 mL, ready to use,
   contains 0.5M H₂SO₄
   Avoid contact with the stop solution. It may cause skin irritations and burns.
8. *Wash Solution*, 1 vial, 30 mL (40X concentrated),
   see „Preparation of Reagents“.
9. *1 N HCl*, 1 vial, 3 mL, ready to use,
   for acidification of the samples.
10. *1 N NaOH*, 1 vial, 3 mL, ready to use,
    for neutralization.

   * BND = 5-bromo-5-nitro-1,3-dioxane
   MIT = 2-methyl-2H-isothiazol-3-one

Note: Additional *Assay Buffer* for sample dilution is available upon request.

4.2 Material required but not provided

− 1.5 mL-Reaction Caps (e.g. from Eppendorf) for sample preparation (acidification and neutralization).
− A microtiter plate calibrated reader (450 ± 10 nm)
− Calibrated variable precision micropipettes.
− Absorbent paper.
− Distilled or deionized water
− Universal indicator paper.
− Timer
− Semi logarithmic graph paper or software for data reduction
4.3 Storage Conditions
When stored at 2-8°C unopened reagents, except the Stock Standard, will retain reactivity until expiration date. Do not use reagents beyond this date.
Immediately after receipt the Stock Standard has to be stored frozen at -20°C.

Opened reagents must be stored at 2-8°C, or as described in chapter 4.4.
Microtiter wells must be stored at 2-8°C. Once the foil bag has been opened, care should be taken to close it tightly again.
Opened kits retain activity for 6 weeks if stored as described above.

4.4 Reagent Preparation
Allow all reagents and required number of strips to reach room temperature prior to use.

Assay Buffer
Dilute 10 mL of concentrated Assay Buffer with 90 mL deionized water to a final volume of 100 mL Working Assay Buffer

Standards
Serial Dilution of the Stock Standard (1,000 pg/mL):

<table>
<thead>
<tr>
<th>Description</th>
<th>Concentration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard A</td>
<td>1,000 pg/mL</td>
</tr>
<tr>
<td>Standard B</td>
<td>1 mL Standard A + 1 mL Assay Buffer 500 pg/mL</td>
</tr>
<tr>
<td>Standard C</td>
<td>1 mL Standard B + 1 mL Assay Buffer 250 pg/mL</td>
</tr>
<tr>
<td>Standard D</td>
<td>1 mL Standard C + 1 mL Assay Buffer 125 pg/mL</td>
</tr>
<tr>
<td>Standard E</td>
<td>1 mL Standard D + 1 mL Assay Buffer 62.5 pg/mL</td>
</tr>
<tr>
<td>Standard F</td>
<td>1 mL Standard E + 1 mL Assay Buffer 31.25 pg/mL</td>
</tr>
<tr>
<td>Standard G</td>
<td>2 mL Assay Buffer 0 pg/mL</td>
</tr>
</tbody>
</table>

Note: The diluted standards are stable for 1 week at 2-8°C. For longer storage freeze at -20°C.

Wash Solution
Add deionized water to the 40X concentrated Wash Solution.
Dilute 30 mL of concentrated Wash Solution with 1170 mL deionized water to a final volume of 1200 mL.
The diluted Wash Solution is stable for 2 weeks at room temperature.

4.5 Disposal of the Kit
The disposal of the kit must be made according to the national regulations. Special information for this product is given in the Material Safety Data Sheets (see chapter 13).

4.6 Damaged Test Kits
In case of any severe damage to the test kit or components, IBL has to be informed in writing, at the latest, one week after receiving the kit. Severely damaged single components should not be used for a test run.
They have to be stored until a final solution has been found. After this, they should be disposed according to the official regulations.
5 SPECIMEN COLLECTION AND PREPARATION
Serum or plasma (EDTA- or citrate plasma) and cell culture supernatant can be used in this assay. Do not use haemolytic, icteric or lipaemic specimens.
Please note: Samples containing sodium azide should not be used in the assay.

5.1 Specimen Collection
Serum:
Collect blood by venipuncture (e.g. Sarstedt Monovette # 02.1388.001), allow to clot, and separate serum by centrifugation at room temperature. Do not centrifuge before complete clotting has occurred. Patients receiving anticoagulant therapy may require increased clotting time.

Plasma:
Whole blood should be collected into centrifuge tubes containing anti coagulant and centrifuged immediately after collection.
(E.g. for EDTA plasma Sarstedt Monovette – red cap - # 02.166.001; for Citrate plasma Sarstedt Monovette – green cap - # 02.167.001.)

5.2 Specimen Storage and Preparation
Specimens should be capped and may be stored for up to 24 hours at 2-8° C prior to assaying. Specimens held for a longer time should be frozen only once at -20° C prior to assay. Thawed samples should be inverted several times prior to testing.

5.3 Specimen Dilution
5.3.1 Serum and plasma
Serum and Plasma Samples should be diluted 1:50 with Assay Buffer prior to testing.
Please note: The results have to be multiplied with the dilution factor (x 50).
Example:
dilution 1:50: 10 µL Serum + 490 µL Assay Buffer (mix thoroughly)

5.3.2 Cell Culture Samples
Centrifuge the Cell Culture Samples. Dilute the supernatant with Assay Buffer, according to the expected TGF-β2 concentrations, e.g. 1:10, if a high TGF-β2 concentration is expected. The results have to be multiplied with the dilution factor.
Example:
dilution 1:10: 10 µL Sample + 90 µL Assay Buffer (mix thoroughly)

If in an initial assay, a specimen is found to contain more than the highest standard, the specimens can be further diluted with Assay Buffer and reassayed as described in Assay Procedure. For the calculation of the concentrations this additional dilution factor has to be taken into account.

5.4 Acidification and Neutralization of Samples and Standards
1. Add 200 µL Standards or prediluted Sample into Reaction Caps (e.g. Eppendorf-Caps).
   Please note: The standards, which have been prepared by serial dilution of the stock standard should also be prepared as described below.
2. Add 20 µL 1 M HCl to all caps
3. Close cups, mix thoroughly (vortex) and let stand for 15 minutes
4. Add 20 µL 1 M NaOH for neutralization and mix thoroughly.
5. After neutralization the sample should have a pH value between 7 and 8. Therefore please check the pH value with Universal Indicator Paper!
6 ASSAY PROCEDURE

6.1 General Remarks
− All reagents and specimens must be allowed to come to room temperature before use. All reagents must be mixed without foaming.
− Once the test has been started, all steps should be completed without interruption.
− Use new disposable plastic pipette tips for each standard, control or sample in order to avoid cross contamination.
− Absorbance is a function of the incubation time and temperature. Before starting the assay, it is recommended that all reagents are ready, caps removed, all needed wells secured in holder, etc. This will ensure equal elapsed time for each pipetting step without interruption.
− As a general rule the enzymatic reaction is linearly proportional to time and temperature.

6.2 Test Procedure
Each run must include a standard curve.

1. Secure the desired number of Microtiter wells in the frame holder.
2. Dispense 100 µL of each pretreated Standard, Control and samples with new disposable tips into appropriate wells.
   (Please refer to chapters “Specimen Dilution” and “Acidification and Neutralization of Samples and Standards”.)
3. Cover the plate and incubate 3 hours at room temperature.
4. Briskly shake out the contents of the wells. Rinse the wells 3 times with diluted wash solution, 300 µl per Well. Strike the wells sharply on absorbance paper to remove residual droplets. **Important note:** The sensitivity and precision of this assay is markedly influenced by the correct performance of the washing procedure!
5. Dispense 100 µl Enzyme Conjugate into each well.
6. Incubate 120 minutes at room temperature.
7. Briskly shake out the contents of the wells. Rinse the wells 3 times with diluted wash solution, 300 µl per Well. Strike the wells sharply on absorbance paper to remove residual droplets.
8. Dispense 100 µl Enzyme Complex into each well.
9. Incubate 20 minutes at room temperature.
10. Briskly shake out the contents of the wells. Rinse the wells 3 times with diluted wash solution, 300 µl per Well. Strike the wells sharply on absorbance paper to remove residual droplets.
11. Add 100 µL of Substrate Solution to each well.
12. Incubate for 10 minutes at room temperature.
13. Stop the enzymatic reaction by adding 50 µL of Stop Solution to each well.
14. Determine the absorbance (OD) of each well at 450 ± 10 nm with a microtiter plate reader. It is recommended that the wells be read within 10 minutes after adding the Stop Solution.
6.3 Calculation of Results
1. Calculate the average absorbance values for each set of standards, controls and patient samples.
2. Construct a standard curve by plotting the mean absorbance obtained from each standard against its concentration with absorbance value on the vertical (Y) axis and concentration on the horizontal (X) axis.
3. Using the mean absorbance value for each sample determine the corresponding concentration from the standard curve.
4. Automated method: The results in the IFU have been calculated automatically using a 4 PL (4 Parameter Logistics) curve fit. 4 Parameter Logistics is the preferred method. Other data reduction functions may give slightly different results.
5. The concentration of the samples can be read directly from this standard curve. Multiply the results by the initial dilution factor (for serum serum and plasma samples by 50
Samples with concentrations higher than that of the highest standard have to be further diluted. For the calculation of the concentrations this dilution factor has to be taken into account.

7 EXPECTED NORMAL VALUES
It is strongly recommended that each laboratory should determine its own normal and abnormal values.

Data can be obtained by request.

8 QUALITY CONTROL
Good laboratory practice requires that controls be run with each calibration curve. A statistically significant number of controls should be assayed to establish mean values and acceptable ranges to assure proper performance.
It is recommended to use control samples according to state and federal regulations. The use of control samples is advised to assure the day to day validity of results. Use controls at both normal and pathological levels.
The controls and the corresponding results of the QC-Laboratory are stated in the QC certificate added to the kit. The values and ranges stated on the QC sheet always refer to the current kit lot and should be used for direct comparison of the results.
Employ appropriate statistical methods for analysing control values and trends. If the results of the assay do not fit to the established acceptable ranges of control materials patient results should be considered invalid.
In this case, please check the following technical areas: Pipetting and timing devices; photometer, expiration dates of reagents, storage and incubation conditions, aspiration and washing methods.
After checking the above mentioned items without finding any error contact your distributor or IBL directly.

9 PERFORMANCE CHARACTERISTICS
9.1 Assay Dynamic Range
The range of the assay is between 10 – 1000 pg/mL.

9.2 Specificity of Antibodies (Cross Reactivity)
The following substances were tested for cross reactivity of the assay:

<table>
<thead>
<tr>
<th>Component</th>
<th>Cross reactivity</th>
</tr>
</thead>
<tbody>
<tr>
<td>TGF-β1</td>
<td>none</td>
</tr>
<tr>
<td>TGF-β3</td>
<td>none</td>
</tr>
</tbody>
</table>

9.3 Sensitivity
The analytical sensitivity was calculated from the mean plus two standard deviations of twenty (20) replicate analyses of Standard 0 and was found to be 10 pg/mL.

9.4 Reproducibility
Data can be obtained on request.

9.5 Recovery
Data can be obtained on request.

9.6 Linearity
Data can be obtained on request.
10 LIMITATIONS OF USE
Reliable and reproducible results will be obtained when the assay procedure is performed with a complete understanding of the package insert instruction and with adherence to good laboratory practice. Any improper handling of samples or modification of this test might influence the results.

10.1 Interfering Substances
Data can be obtained on request.

10.2 Drug Interferences
Until today no substances (drugs) are known to us, which have an influence to the measurement of TGF-β2 in a sample.

10.3 High-Dose-Hook Effect
Data can be obtained on request.

11 LEGAL ASPECTS

11.1 Reliability of Results
The test must be performed exactly as per the manufacturer’s instructions for use. Moreover the user must strictly adhere to the rules of GLP (Good Laboratory Practice) or other applicable national standards and/or laws. This is especially relevant for the use of control reagents. It is important to always include, within the test procedure, a sufficient number of controls for validating the accuracy and precision of the test. The test results are valid only if all controls are within the specified ranges and if all other test parameters are also within the given assay specifications. In case of any doubt or concern please contact IBL.

11.2 Therapeutic Consequences
Therapeutic consequences should never be based on laboratory results alone even if all test results are in agreement with the items as stated under point 11.1. Any laboratory result is only a part of the total clinical picture of a patient. Only in cases where the laboratory results are in acceptable agreement with the overall clinical picture of the patient should therapeutic consequences be derived. The test result itself should never be the sole determinant for deriving any therapeutic consequences.

11.3 Liability
Any modification of the test kit and/or exchange or mixture of any components of different lots from one test kit to another could negatively affect the intended results and validity of the overall test. Such modification and/or exchanges invalidate any claim for replacement. Claims submitted due to customer misinterpretation of laboratory results subject to point 11.2. are also invalid. Regardless, in the event of any claim, the manufacturer's liability is not to exceed the value of the test kit. Any damage caused to the test kit during transportation is not subject to the liability of the manufacturer.

**LIABILITY:** Complaints will be accepted in each mode –written or vocal. Preferred is that the complaint is accompanied with the test performance and results. Any modification of the test procedure or exchange or mixing of components of different lots could negatively affect the results. These cases invalidate any claim for replacement. Regardless, in the event of any claim, the manufacturer’s liability is not to exceed the value of the test kit. Any damage caused to the kit during transportation is not subject to the liability of the manufacturer.
